

Software

Cut Rite cutting optimization software

Cut Rite – the optimization software for efficient cutting processes

The Cut Rite optimization software is used by thousands of companies, with more than ten thousand users located in over 70 countries. The name says it all: Cut Rite transforms slow panel cutting into a more efficient process that saves time and reduces wastage, saving a lot of money. The software offers compatibility with a vast range of machines from sliding table saws and CNC beam saws to routers and machining centers. At the heart of Cut Rite is its powerful optimization engine which has been developed and fine-tuned over the past 35 years and is supported by software modules for every part of your manufacturing operation. To put it briefly, as far as optimization is concerned, Cut Rite is exactly the right solution for you.

Contents

- 04 Top features
- 06 Process integration
- 08 What's included
- 10 Part library and label printing
- 11 Order processing and variable parts lists
- 12 CNC programming and linking
- 13 Destacking
- 14 Stock control
- 15 Saw? Nesting? Both? No problem!

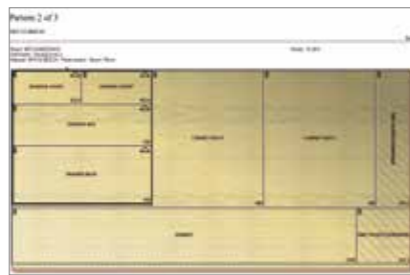

Cut Rite – top features for your manufacturing process

We support you with a team of developers and support technicians to ensure that Cut Rite drives your company's production processes forward. Our update and service contracts give you access to all the latest features, allowing you to extend your lead. Training for all modules is provided by us or by certified partners. This shortens the start-up phase.

Rules editor for cutting lists

This editor allows you to define rules for data handling and for automatic generation of data specifically to suit your manufacturing process. Key figures can then be calculated fully automatically in an instant.

Grain matching

Templates define the position of parts in the cutting pattern – either in order to achieve a uniform veneer pattern or to group narrow parts before edging.

The algorithm: default fast

Cut Rite's calculating engine uses all your computer's processors. This increases the number of computer operations, achieving optimum results very quickly.

Graphic cutting pattern editor

With other programs, you have to start again from the beginning if there is a change to the parts list, or if you want to cut an optimized pattern differently. With Cut Rite, you simply grab the mouse and enter the changes directly in the cutting pattern in a matter of seconds.

Calculating material and machine costs

A big advantage when preparing quotations: Cut Rite immediately indicates the material costs and calculates the machining time. You are able to calculate orders accurately and benefit from easier production planning.

Integrated material database

Here you can set up data for all your panel materials, enter panel usage and register offcuts so that they can be used later. Connection to horizontal storage systems is child's play, thanks to modular extensions.

User-friendliness is key

Cut Rite has always had an outstanding reputation for ease of use. It features a modern interface, countless input aids and options for automating important processes.

User profiles

You can create a profile for each user – with password, paths and much more. Users immediately feel at home with the software and can use the functions they need.

Your company – your overview

You decide what is important and configure the reporting options according to your needs: from the simple allocation of information to the standard summaries to configuration of your own reports and fully automatic calculation of additional data. Furthermore, Cut Rite prepares all the data for label printing. You can then print the labels in the office (included as standard in Cut Rite) or optionally directly at the machine in time with the cuts.

Perfectly integrated in the overall process

Clearly structured and easy to use – that’s Cut Rite’s formula for your success. All the features that are important for your daily work are already included in Cut Rite LITE, PRACTIVE and PROFESSIONAL. The modular design allows you to add other options as and when you need them. Adding more options is possible at any time, as is increasing the number of licenses. The package is rounded off by the possibility of automating many functions, which reduces manual operation to a minimum.

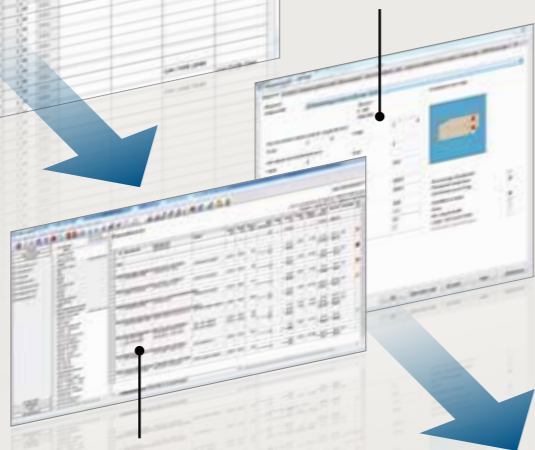

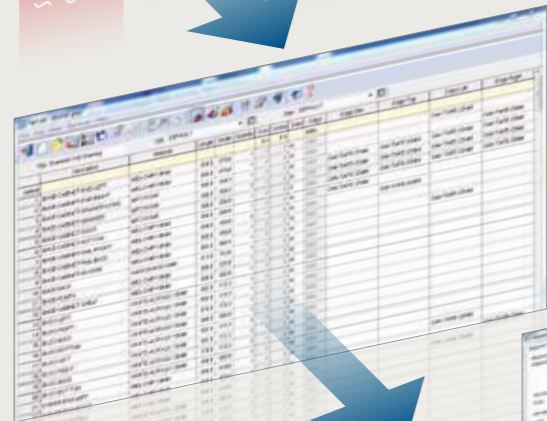

Industry-standard software

Cut Rite is compatible with all common industry solutions. Parts list tables in PTX, CSV or XLS format can be transferred with all information at the touch of a button.

Customized parameters

You set the standards for your cutting process, not the software! Detailed parameter settings allow you to align the optimization results to your specific manufacturing process. All configuration options are graphically visualized and so easy to find and use. An intelligent, user-friendly help system also provides support.

Tailored reporting

Reporting options can be configured to your requirements and all the results clearly portrayed. Key figures are instantly available.

Saw interface – PTX format		✓	✓	✓
Stress elimination cuts		✓	✓	

Part library and label printing: for better management and tracking of parts

This module helps you gear up for production faster by instantly generating data for all your most frequently used parts. Simply by using just the part codes to pull items into a parts list, you can enter cutting lists quickly and accurately and create factory route cards at the press of a button, speeding up production.

Features and benefits

- The part library can hold details of size, material, grain and edging, as well as plenty of user-defined information for each part.
- You can generate detailed labels with multiple bar codes and graphics – for fast setup of CNC machines equipped with bar code scanners.
- The library can also hold a list of regularly used hardware components such as hinges, screws and drawer slides with their costs.
- The part dimensions and other fields may be parametric and specified at order entry if required.
- Labels can be printed in the office in the sequence of cutting or directly at the machine.
- A list of operation times can be held for each part and be used to build up a full part cost.

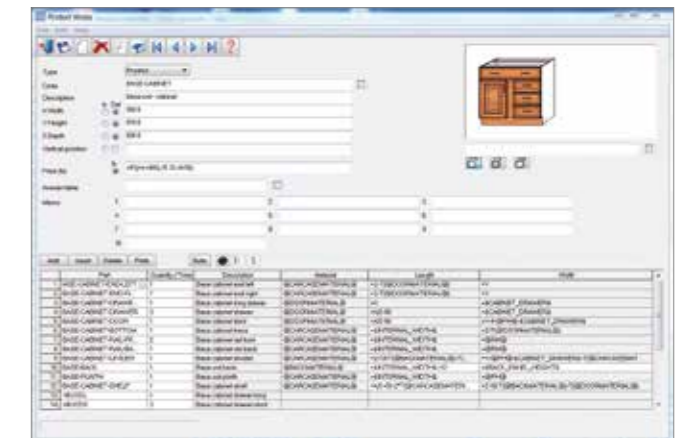

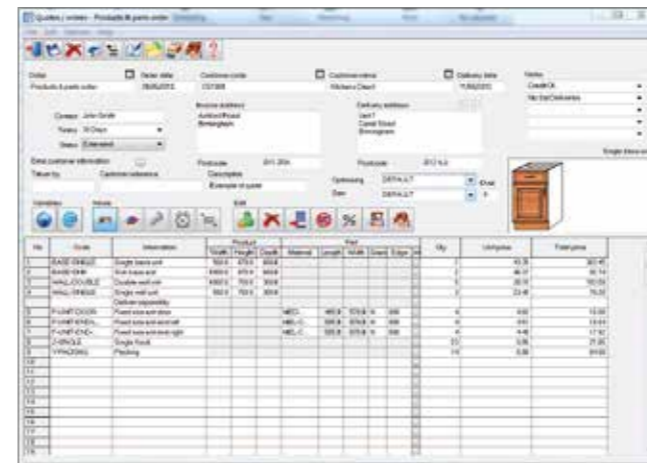

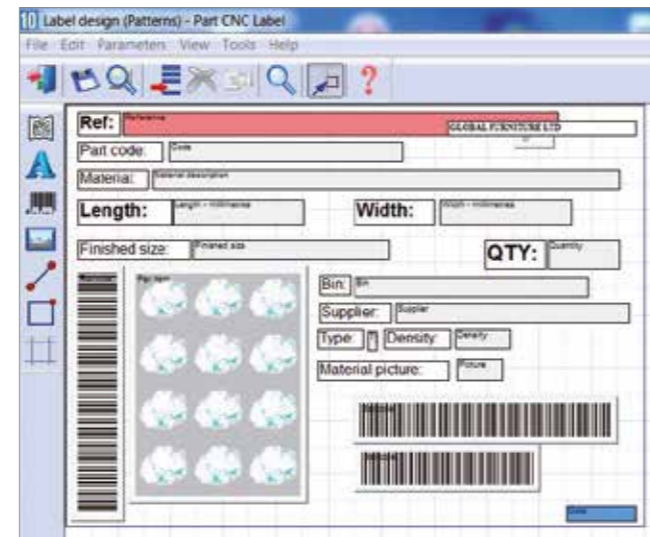

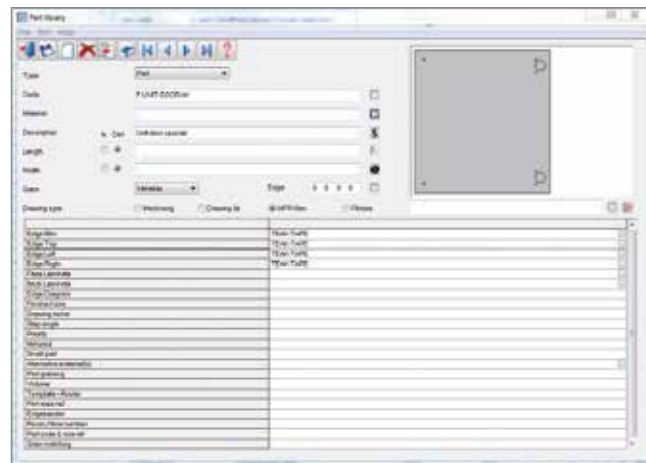

Order processing and variable parts lists: for fast response to inquiries and orders

This module helps you create quotations and process orders quickly and easily. The parametric product library allows Cut Rite to detail every order, including all standard or custom products, parts, hardware and operations. You will only need to enter your data once to produce order acknowledgments, dispatch notes, invoices and a complete calculation of all costs.

Features and benefits

- Customer database with full contact details, invoicing address, multiple delivery addresses, discounts and free-format notes fields.
- User-defined product 'variables' take account of order-based requirements such as material color and thickness, and hardware options.
- Flexible form designer allows tailor-made documents to include company logo, graphics and bar codes with full control of font and positioning.
- Use of formulae and user-defined tables enables automatic calculation of component sizes for special cabinets, and allows parametric pricing.
- You can attach image files (BMP, EMF ...) or use Cut Rite's own drawing library to add drawings to your product catalog.
- At the touch of a button, you can obtain a picking list with the calculation of sundry part sizes such as solid lipping or bought-out items.

CNC programming and linking: fast setup of your CNC machines

To streamline production into a seamless highly efficient and accurate process, simply choose this module. It creates a fully integrated manufacturing cell by downloading part drawings directly to your point-to-point machining center. Parts are labeled at the saw. The label includes a bar code for the drawing reference. Scanning at the machining center provides a foolproof and fast process that ensures each part is machined correctly.

Features and benefits

- The geometry for rectangular or shaped parts can be drawn quickly using the editor, or can be imported from DXF files.
- The machining library holds parametric drawings so that as the part size changes, the machining instructions are recalculated instantly.
- The module offers support for drilling, grooving, contour routing, operations on both sides of part, vacuum pod positions, dimension lines and pockets.
- Details of depths and tooling information can be added for each operation, including tool speeds, tool path compensation and other tool-specific data.
- The machining interface allows direct transfer of data to most CNC-controlled machining centers via DXF and proprietary formats.
- Labels or route sheets can include the part drawing.
- Machining times can be estimated for each part.
- If used alongside woodWOP, all MPR programs can be used and also transferred to the CNC machine.

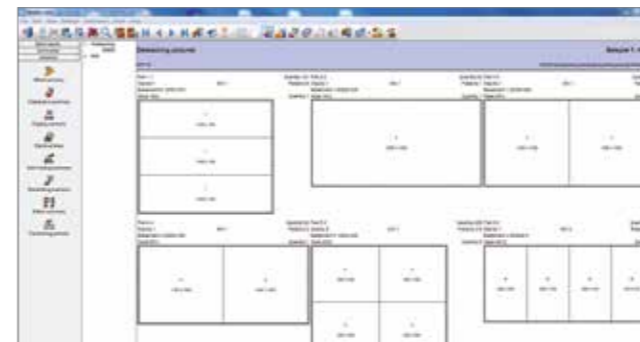

Destacking: for efficiency and fast throughput

You can keep production running smoothly by using the destacking module, which rationalizes throughput at the saw by planning the destacking process. It gives you a list of pallet requirements or a baseboard cutting list and, based on the size of your mechanized destacking stations, will limit the number of open parts. This ensures that finished items go to the assembly department as quickly as possible.

Features and benefits

- A station report provides information for conveying parts to the correct pallets or baseboards in the destacking area.
- The module calculates a cutting list for baseboards from the part sizes allowing for oversize allowance, layout constraints and maximum stacking height.
- A destacking summary shows the operator, pattern by pattern, on which pallet each part must be placed.
- The layout of parts on each pallet or baseboard can be downloaded to automatic destacking equipment.
- You can print labels for pallets or stacks when used with the "part library and label printing" module.
- The destacking module includes an advanced optimizing algorithm which obeys maximum station sizes when allocating parts to stations.

Stock control: for accurate and efficient inventory management

This invaluable module protects your profit margin by minimizing downtime caused by lack of stock. How? By helping you accurately track your raw materials and by adding offcuts back to stock. This ensures no reusable material is wasted, so you systematically increase material yield. Panels can be allocated to jobs in advance so that you do not optimize the same offcut on different jobs.

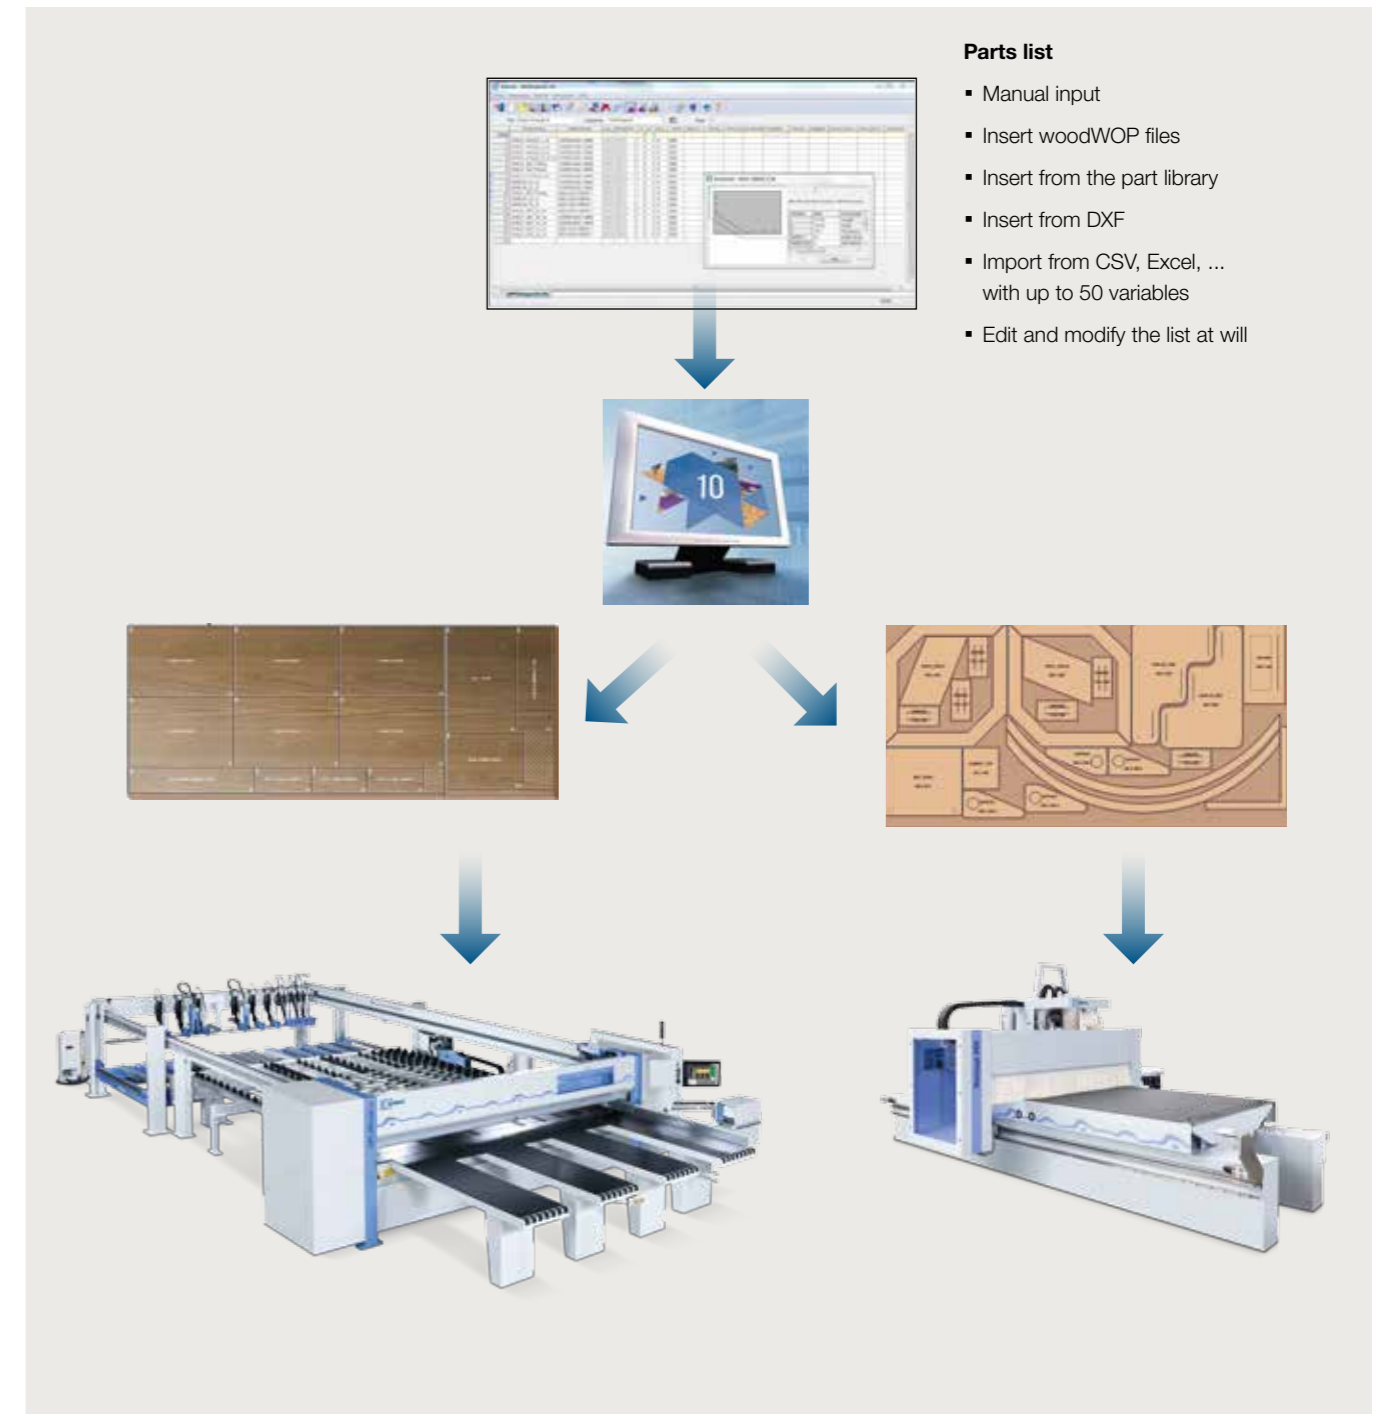

Features and benefits

- This module helps you check stock levels, record raw material orders and book in receipts from your suppliers.
- It considers available free stock (physical stock less allocations) and automatically adjusts stock after cutting.
- Configurable reports include stock valuation, minimum stock levels, monthly summary of stock usage and an audit trail of all stock movements.
- It automatically updates both core material and laminate stock, when you laminate complete panels prior to cutting.
- Physical stock control of hardware and edge banding material – only when used in conjunction with the “order processing and variable parts lists” and “edging and laminating” modules.
- Interface to automatic storage handling systems for synchronization of panel and offcut stock via SQL Server database.

Saw? Nesting? Both? No problem!

Cut Rite gives you the flexibility to choose, because it is able to supply both cutting systems with data concurrently. Cut Rite recognizes from the parts lists which machine you want to use and generates the appropriate data. You can create the contour elements for each part as MPR file (e.g. with woodWOP), use DXF data, or program them directly in Cut Rite. If only rectangular parts are to be cut on a saw or CNC machine, a simple parts list without individual part programs is sufficient.
